- **IC Identification module (IIM)**

The microprocessor control package consists of printed circuit boards in an enclosure designed to be mounted within a system control panel. Removable terminal blocks allow for easy wiring and installation. Controls Hydro turbines driving electrical generators. Its configurable program provides control of Francis turbines. Provides the electronic brains to control the turbine's hydraulic control system and auxiliary functions and operates as either a stand-alone unit governor or in conjunction with a plant's Distributed Control System (DCS).

Contains a customized program with a fixed number of inputs and outputs. The inputs and outputs can be programmed to meet specific customer's requirements. It also provides several user-selectable features including starting, stopping, gate positioning, speed control, load control, bondage level control, and automatic-manual / local-remote operation. A first-out indication feature for system shutdowns reduces troubleshooting time. The menu-driven software allows program configuration of the control for a specific application.

Includes a graphical front panel screen and related keypad or capacitive touch screen panel. It provides monitoring and operational information. System configuration is done through Interfacing software. The display presents easy-to-follow instructions in plain English expressed in engineering units. Discrete and analog input and output signals can be wired directly to the controller to control the unit externally.

Communicates directly with HMI-based operator control panels and/or the plant's DCS through four Ethernet ports using Modbus TCP or OPC communication protocols, or via one serial Modbus port. The single serial port supports RS-232 or RS-485 communications using ASCII or RTU Modbus protocols. The discrete and analog input and output signals can also be hard-wired directly to a DCS if required by the application. Communications between the governor controller and a plant DCS can also be performed through hardwired connections.

The governor controller is field configurable via interface software, allowing site engineers to configure the control to their specific application, and to make future control configuration changes. Online tunable are available to allow set point adjustments while a unit is running. Inputs and Outputs are programmable as required by the application or interface.

The Governor Controller System Manufacturer should be ISO or any Japanese, American and European Quality Standard certified and has independent domain website.

#### **TS-6.2 Speed Sensing Device**

The speed sensing device is equipped with speed sensing redundancy. The two method sensing used are PT signal interface and Proximity switch via optical sensor. Each method should have spare units. Mounting bracket should be included during installation.

**TS-6.3. Wicket Gate Position Sensor (MLDT)**

The Wicket Gate Position Sensor (MLDT) Should be compatible to the supplied digital governor controller.

Magneto strictive linear displacement transducer (MLDT) is installed in the turbine pit and is wired to an analog input module of the digital governor controller. This provides a direct electronic feedback (4-20mA) of the turbine servomotor position. MLDT consists of one part fixed in position while the other part moves with the mechanism whose displacement is being measured.

The micro pulse transducer contains a tubular waveguide enclosed by an outer stainless rod. A magnet attached to the moving member of the machine or to the cylinder piston is moved over the rod and its position constantly updated.

The micro pulse transducer contains a tubular waveguide enclosed by an outer stainless rod. A magnet attached to the moving member of the machine or to the cylinder piston is moved over the rod and its position constantly updated.

The magnet defines the measured position on the waveguide. An Internally generated pulse interacts with the magnetic field of the magnet to generate a magneto strictive torsional wave in the waveguide which propagates at ultrasonic speed.

The torsional wave arriving at the end of the waveguide is absorbed in the damping zone. The wave arriving at the beginning of the waveguide creates an electrical signal in the coil surrounding the waveguide. The propagation time of the wave is used to derive the position. Depending on the version, the corresponding value is output as a voltage or a current either with rising or falling characteristic. This process takes place with measuring high precision and repeatability within the stroke range defined as nominal stroke length.
